

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

RATTLESNAKES ON CATALINA ISLAND.

Van Denburgh and Slevin (Proc. Calif. Acad. of Sci., 4th Ser., Vol. IV, pp. 138-139) state that the presence of rattlesnakes on Catalina Island off the coast of southern California was first recorded by Yarrow from a specimen taken there by Mr. Schumacher in 1876. One additional specimen only is recorded. In that so little is known of *Crotalus oregonus* on the island, the following notes may be of interest:

During July, 1906, while camped at Whites Landing, I killed a rattlesnake about two feet long. The specimen was not saved. I believe that several other specimens were killed during the summer. At that time rattlesnakes were considered fairly common over the greater part of the eastern slope of the island.

Mr. Murray L. Royar, who has just returned from a summer spent at Avalon, has donated to the Museum of Vertebrate Zoology a small specimen of *Crotalus oregonus* taken at Avalon on August 2, 1915. Mr. Royar reports that old-timers on Catalina Island say that there were no rattlesnakes on the island in early days. Later, when hay and other crops were introduced, rattlesnakes appeared. The reptiles were first seen around barns and near civilization and later took to the hills. He also states that even at the present time few are found far inland.
